Executive Summary

1. This data consists of age group between 30 - 50 but most people belong to 30 -35. Out of them
2. we can identify that the there are lots of people who are having less salary levels (less than 50000). And there is a few people who are having higher earnings.
3. When the education level increases the salary also increases.
4. Initially when the hours of work are increasing, the earnings are increasing. When it reaches to some level (nearly 2000 hours), earnings are decreasing.
5. Earnings do not highly depend on the age level. People who are young can earn higher salaries or lower salaries and vise versa.
6. Individuals have averagely worked around 1500 hours annually
7. Average working hours and average earnings of members.
8. Divorced people shows high working hours compared to others.
9. Most of the individuals are form education level 11 - 13
10. There is no relationship between earnings and marital status

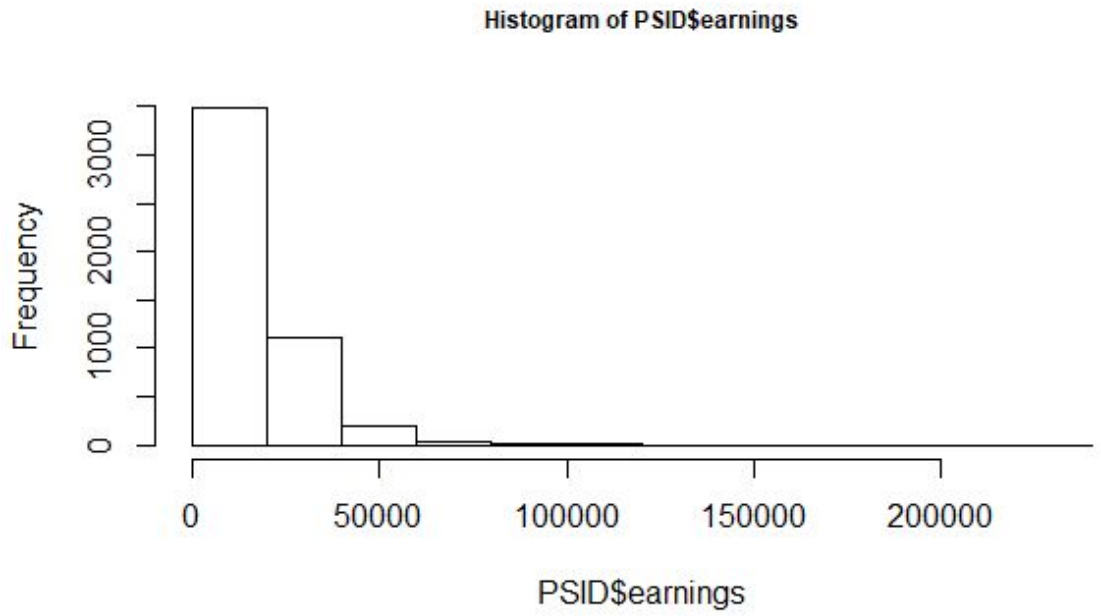
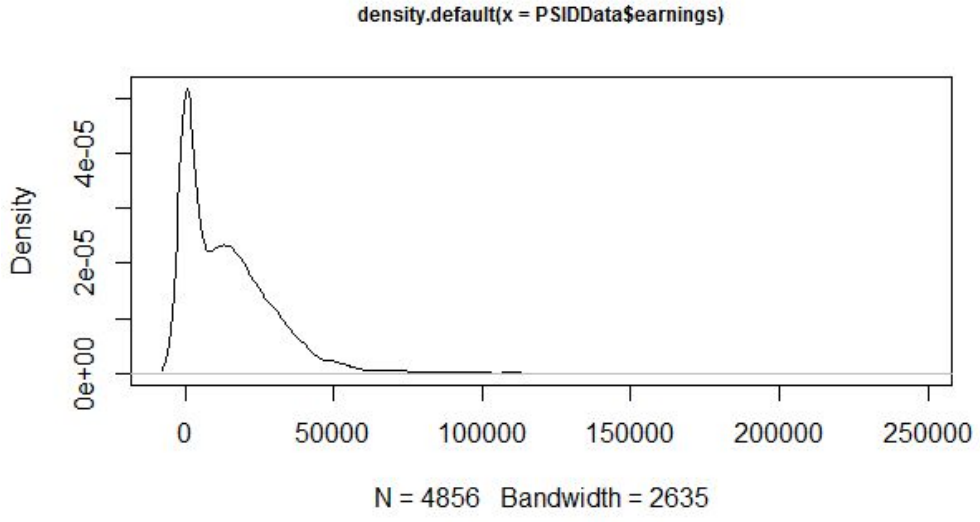
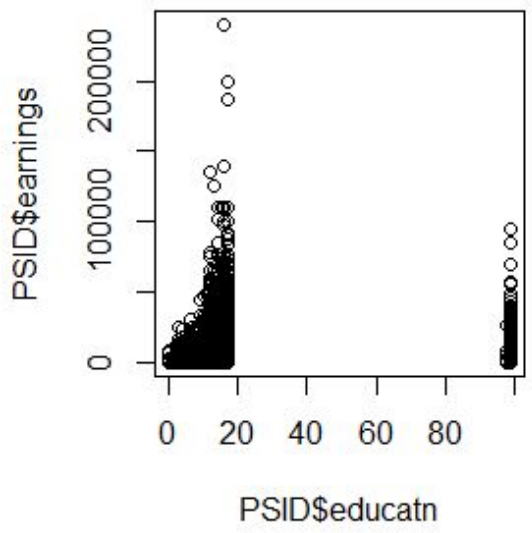
Insights

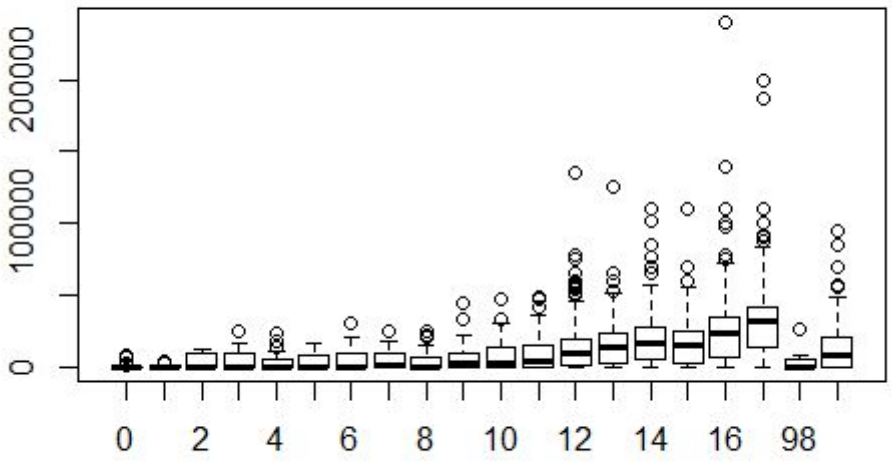




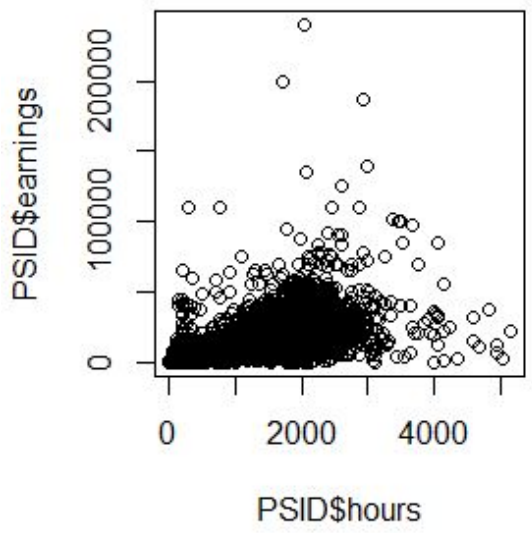
Above Histogram is drawn with the earnings data. From that we can identify that the there are lots of people who are having less salary (less than 50000). And there is a few people who are having higher earnings.



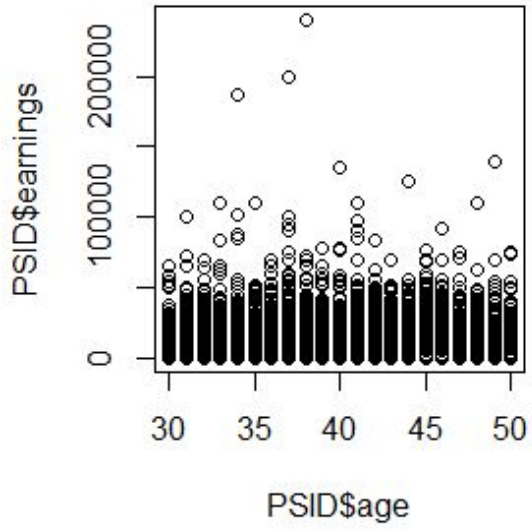
Above plot compares education level of the people in the data set with the earnings. We can say that when the education level increases the salary also increases. Education level which is within 90's range was considered as outliers.



This diagram depicts how earnings are varying in terms of education level. According to the data distribution, upto level 17 earnings are getting increased. We observed from 17 there is a huge gap of education as 98. Those would be outliers of the dataset.



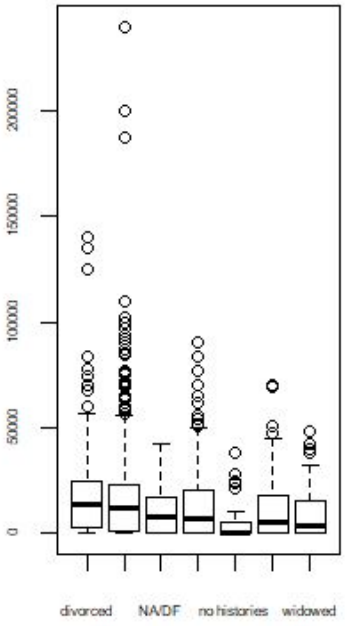
Above plot compares the hours people do work and the earnings. It shows that initially when the hours of work are increasing, the earnings are increasing. When it reaches to some level (nearly 2000 hours), earnings are decreasing.But these is a problem that since we exactly do not know the number of people who are shown in the black area.



Above plot compares the age and the earnings. Generally we think that when people grow old, their earnings will increase gradually, since people will get promotions and etc. But here we cannot see that trend. It is more or less the same. But these is a problem that since we exactly do not know the number of people who are shown in the black area.

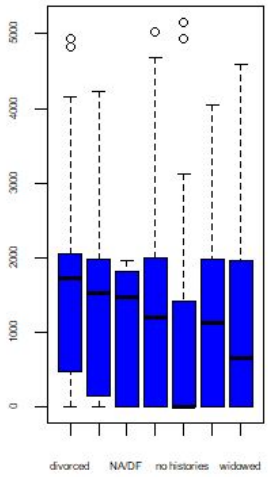
Below table shows how mean of earnings are varies according to their marital status

#	Marital Status	Mean
1	divorced	16486.755
2	married	14990.662
3	NA/DF	11577.778
4	never married	11698.154
5	no histories	4390.860
6	separated	10650.921
7	widowed	9613.878



By looking at this we can say there is no a good relationship between marital status and the earnings.

Relationship between total working hours and marital status of person. According to this graph divorced person has high working hours.



Age Vs Education Vs Earnings
This is the comparison of age, education and earnings
